

Question 1
 Given are the following two syntactically different regular expressions:

$$R1 := ((a|b)^*.c^*.(a^*|b^*)^*)^*$$

$$R2 := (a^*|b^*)^*.(c|(a|b)^*)^*$$

Investigate by way of the DFA_{min} method whether $L(R1) = L(R2)$.

[2 Points]

Question 2
 Given is the somewhat "ambiguous" English sentence

$s :=$ Susan opens the file with the password

Construct a small context-free grammar G (with only a few rules) for "very simple English", such that s is in $L(G)$, and demonstrate with the help of s that your grammar G is an *ambiguous* grammar.

Advice: Make sure to give meaningful grammatical names to the Non-Terminal symbols of G (e.g.: Sentence, Subject, Object, Predicate, Noun, Verb, or similar linguistic terms), such that the exam's assessor (marker) is easily convinced about s being in $L(G)$.

Question 3
 Apply the Look-Ahead (LA)-Set method to investigate whether the following grammar is suitable for LL1 parsing (whereby any blank_spaces are to be ignored as irrelevant, and **bold** symbols shall be regarded as **terminal** symbols):

[4 Points]

COMMAND	::= c
COMMAND	::= IFTHENELSE
IFTHENELSE	::= i BOOLEAN t COMMAND ALTERNATIVE
ALTERNATIVE	::= e COMMAND
ALTERNATIVE	::= // epsilon, nothing
BOOLEAN	::= b

Question 4
 Let L_{dyn} be some programming language with *dynamic scoping* for function-calls. Explain briefly,

[2 Points]

- which data structure will be best for the implementation of the *symbol table* in the compiler of L_{dyn} ,
- and why that is so.

Question 5
 a) With reference to Theoretical Computer Science, explain briefly why a static type-checker

[2 Points]

- cannot be both correct and complete.
- What is the *practical consequence* of this fundamental theorem?

There are no further questions.

Question 1

5

NFA R1:

NFA to DFA

$S_0 = \{A, B, C, D, E, G, H, I, J, K, L, M, N, O\}$ with ϵ

$$\text{move}(S_0, \epsilon) = \epsilon\text{-closure}(\{F, J\})$$

$$= \{F, J, A, B, C, D, E, G, H, I, K, L, M, N, O\}$$

$$= S_1$$

$$\text{move}(S_0, b) = \epsilon\text{-closure}(\{F, L\})$$

$$= \{F, L, A, B, C, D, E, G, H, I, J, K, M, N, O\}$$

$$= S_1$$

$$\text{move}(S_0, c) = \epsilon\text{-closure}(\{G\})$$

$$= \{G, A, B, C, D, E, H, I, J, K, L, M, N, O\}$$

$$= S_0$$

$$\text{move}(S_1, a) = \epsilon\text{-closure}(\{F, J\})$$

$$= \{F, J, A, B, C, D, E, G, H, I, K, L, M, N, O\}$$

$$= S_1$$

seen

$$\begin{aligned} \text{move}(s_1, b) &= \text{closure}(\{F, M\}) \\ &= \{F, M, A, B, C, D, E, F, G, H, I, J, K, L, N, O\} \\ &= S_1 \end{aligned}$$

$$\begin{aligned} \text{move}(s_1, c) &= \text{closure}(\{G\}) \\ &= \{C, A, B, D, E, F, G, H, I, J, K, L, M, N, O\} \\ &= S_1 \end{aligned}$$

min DFA :

$G_1 : \{s_0, s_1\}$

Both are accepting, so we don't have another division.

eg

G_1	a	b	c
s_0	G_1	G_1	G_1
s_1	G_1	G_1	G_1

$\therefore G_1$ is maximally consistent.

NFA R2:

NFA to DFA:

$S_0 : \{A, B, C, D, E, F, G, H, I, J, K, L, N, O\}$

$$\text{move}(S_0, a) = \epsilon \text{ closure}(\{C, M\})$$

$$= \{C, M, A, B, D, E, F, G, H, I, J, K, L, N, O\}$$

$$= S_1$$

$$\text{move}(S_0, b) = \epsilon \text{ closure}(\{E, M\})$$

$$= \{E, M, A, B, C, D, F, G, H, I, J, K, L, N, O\}$$

$$= S_1$$

$$\text{move}(S_0, c) = \epsilon \text{ closure}(\{N\})$$

$$= \{N, A, B, C, D, E, F, G, H, I, J, K, L, N, O\}$$

$$= S_0$$

$$\text{move}(S_1, a) = \epsilon \text{ closure}(\{C, M\})$$

$$= S_1$$

$$\text{move}(S_1, b) = \epsilon \text{ closure}(\{E, M\})$$

$$= S_1$$

see

$$\text{move}(S_1, c) = \epsilon \text{ closure}(\{N\})$$

$$= \{N, M, A, B, C, D, E, F, G, H, I, J, K, L, M, N, O\}$$

$$= S_1$$

\therefore DFA :

Min DFA : $Q_0 : \{S_0, S_1\}$ (both are accepting, thus 1 group)

	a	b	c
Q_0	Q_1	Q_1	Q_1
S_0	Q_1	Q_1	Q_1
S_1	Q_1	Q_1	Q_1

$\therefore Q_0$ is maximally constant and

min DFA PTO \rightarrow

min DFA :-

correct ✓

$$G_0 = G_1$$

∴ Thus I have proven that the min DFA for both languages are the same, thus $L(R_1) = L(R_2)$ ✓

Question 3.

$$\begin{aligned}\text{First}(\text{command}) &= \text{First}(e) \cup \text{First}(\text{IFTHENELSE}) \\ &= \{e\} \cup \text{First}\{i\} \\ &= \{e, i\}\end{aligned}$$

$$\begin{aligned}\text{First}(\text{IFTHENELSE}) &= \text{First}(i) \\ &= \{i\}.\end{aligned}$$

$$\begin{aligned}\text{First}(\text{Alternative}) &= \text{First}(e) \cup \text{First}(i) \\ &= \{e, i\}.\end{aligned}$$

$$\begin{aligned}\text{First}(\text{Boolean}) &= \text{First}(b) \\ &= \{b\}\end{aligned}$$

$\text{command}' ::= \text{command } \$$	$\{\$ \} \subseteq \text{Follow}(\text{command})$
$\text{command} ::= \text{IFTHENELSE}$	$\text{Follow}(\text{command}) \subseteq \text{Follow}(\text{IFTHENELSE})$
$\text{IFTHENELSE} ::= \text{! Boolean} \dots$	$\{t\} \subseteq \text{Follow}(\text{Boolean}), \text{First}(\text{Alternative}) \subseteq \text{Follow}(\text{command}),$ $\text{Follow}(\text{IFTHENELSE}) \subseteq \text{Follow}(\text{Alternative})$
$\text{ALTERNATIVE} ::= e \text{ (command)}$	$\text{Follow}(\text{ALTERNATIVE}) \subseteq \text{Follow}(\text{COMMAND})$
.	
.	

$$\begin{aligned}\therefore \text{Follow}(\text{command}) &= \{e, \$\} \cup \{e\} = \{e, \$\} \\ \text{Follow}(\text{IFTHENELSE}) &= \{e, \$\} \cup \{e\} = \{e, \$\} \\ \text{Follow}(\text{BOOLEAN}) &= \{t\} \cup \{t\} = \{t\} \\ \text{Follow}(\text{ALTERNATIVE}) &= \{e, \$\}\end{aligned}$$

Let Command

P70

25

$la(\text{Command} := c) = \{c\}$
 $la(\text{Command} := \text{ifthenelse}) = \{i\}$
 $la(\text{ifthenelse} := i \text{ Bool.}) = \{i\}$
 $la(\text{Alternative} := \text{Command}) = \{c\}$
 $la(\text{Alternative} :=) = \{ \}$
 $la(\text{Boolean} := b) = \{b\}$

25

Table.

	c	i	+	e	b
Command.	Command := c	Command := IFTHENELSE Command := ifthenelse			
IFTHENELSE		IFTHENELSE := i Boolean Command Alternative			
Alternative.				Alternative := Command Alternative :=	
Boolean.					Boolean := b

This is ~~not~~ an LL(1) parser because 2 productions,
 share the same first. Thus we are unable
 to uniquely identify a production.

Wrong Conclusion from wrong
 LA-Set

Question 4

a) Stack ✓

b) If the symbol table is implemented as a stack of scopes, it would make dynamic scoping a lot easier to deal with. For example, if a variable "x" occurs in more than one scope, it is always bound to "current" scope (on top of the stack). ✓

Quest

Question 5

a. To "accept" an arbitrary non-terminating program that will not run into any type error during its run time, the type checker would need to "know" for sure whether ~~it~~^{the program} is a halting or a non halting program, however[↑] the halting program is undecidable.

b. The static type checker will reject atleast one type-error-free input program.
